**Background:** This gene is the putative transforming gene of avian sarcoma virus 17. It

encodes a protein which is highly similar to the viral protein, and which interacts directly with specific target DNA sequences to regulate gene expression. This gene is intronless and is mapped to 1p32-p31, a chromosomal region involved in both translocations and deletions in human malignancies. [provided by RefSeq,

Jul 2008],

**Function:** function:Transcription factor that recognizes and binds to the enhancer

heptamer motif 5'-TGA[CG]TCA-3'.,PTM:Phosphorylation enhances the

transcriptional activity. Phosphorylated by PRKDC.,similarity:Belongs to the bZIP family.,similarity:Belongs to the bZIP family. Jun subfamily.,similarity:Contains 1 bZIP domain.,subunit:Heterodimer with either FOS or BATF3. Interacts with HIVEP3 (By similarity). Interacts with SMAD3/SMAD4 heterodimers. Interacts with MYBBP1A, SPIB and TCF20. Interacts with COPS5; indirectly leading to its phosphorylation. Interacts with DSIPI; this interaction inhibits the binding of active

AP1 to its target DNA.,

Subcellular Location:

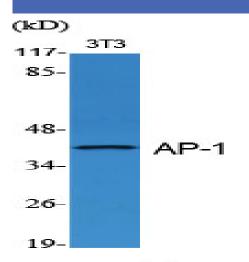

Nucleus.

**Expression:** Expressed in the developing and adult prostate and prostate cancer cells.
