Background : This gene encodes the anterior pituitary hormone prolactin. This secreted

hormone is a growth regulator for many tissues, including cells of the immune system. It may also play a role in cell survival by suppressing apoptosis, and it is essential for lactation. Alternative splicing results in multiple transcript variants

that encode the same protein. [provided by RefSeq, Aug 2011],

Function: function:Prolactin acts primarily on the mammary gland by promoting

lactation.,online information:Prolactin entry,similarity:Belongs to the

somatotropin/prolactin family.,

Subcellular Location:

Secreted.
