**Background:** This gene encodes a member of a family of solute transporter proteins. The

membrane-bound protein is the principal transporter that clears the excitatory neurotransmitter glutamate from the extracellular space at synapses in the central nervous system. Glutamate clearance is necessary for proper synaptic activation

and to prevent neuronal damage from excessive activation of glutamate

receptors. Mutations in and decreased expression of this protein are associated with amyotrophic lateral sclerosis. Alternatively spliced transcript variants of this

gene have been identified. [provided by RefSeg, Sep 2010],

**Function:** function:Transports L-glutamate and also L- and D-aspartate. Essential for

terminating the postsynaptic action of glutamate by rapidly removing released

glutamate from the synaptic cleft. Acts as a symport by cotransporting

sodium.,PTM:Glycosylated.,similarity:Belongs to the sodium:dicarboxylate (SDF)

symporter (TC 2.A.23) family., subunit: Homotrimer. Interacts with JUB.,
