**Cell Pathway:** Regulation of Actin Dynamics; AMPK

**Background:** This gene is a member of the VAV gene family. The VAV proteins are guanine

nucleotide exchange factors (GEFs) for Rho family GTPases that activate pathways leading to actin cytoskeletal rearrangements and transcriptional alterations. This gene product acts as a GEF preferentially for RhoG, RhoA, and to a lesser extent, RAC1, and it associates maximally with the nucleotide-free states of these GTPases. Alternatively spliced transcript variants encoding different isoforms have been described for this gene. [provided by RefSeq, Jul

2008],

**Function:** function: Exchange factor for GTP-binding proteins RhoA, RhoG and, to a lesser

extent, Rac1. Binds physically to the nucleotide-free states of those

GTPases., similarity: Contains 1 CH (calponin-homology)

domain., similarity: Contains 1 DH (DBL-homology) domain., similarity: Contains 1

PH domain., similarity: Contains 1 phorbol-ester/DAG-type zinc finger., similarity: Contains 1 SH2 domain., similarity: Contains 2 SH3

domains., subunit: Interacts with the PH domain of APS.,

Subcellular Location :

intracellular, cytosol, plasma membrane, extracellular exosome,

**Expression:** Isoform 1 and isoform 3 are widely expressed; both are expressed at very low

levels in skeletal muscle. In keratinocytes, isoform 1 is less abundant than isoform 3. Isoform 3 is detected at very low levels, if any, in adrenal gland, bone marrow,

spleen, fetal brain and spinal chord; in these tissues, isoform 1 is readily

detectable.
