Cell Pathway: Regulation of autophagy;

Background: beclin 1(BECN1) Homo sapiens This gene encodes a protein that regulates

autophagy, a catabolic process of degradation induced by starvation. The encoded protein is a component of the phosphatidylinositol-3-kinase (PI3K) complex which mediates vesicle-trafficking processes. This protein is thought to

play a role in multiple cellular processes, including tumorigenesis,

neurodegeneration and apoptosis. Alternative splicing results in multiple

transcript variants. [provided by RefSeq, Sep 2015],

Function: function:Plays a central role in autophagy (By similarity). May play a role in

antiviral host defense. Protects against infection by a neurovirulent strain of

Sindbis virus., similarity: Belongs to the beclin family., subcellular

location:Expressed in dendrites and cell bodies of cerebellar Purkinje

cells.,subunit:Interacts with GOPC and GRID2. Interacts with AMBRA1. Probably forms a complex with AMBRA1 and PIK3C3 (By similarity). Interacts with BCL2

and BCL2L1.,tissue specificity:Ubiquitous.,

Subcellular Cytoplasm . Golgi apparatus, trans-Golgi network membrane ; Peripheral membrane protein . Endosome membrane ; Peripheral membrane protein .

Endoplasmic reticulum membrane ; Peripheral membrane protein . Mitochondrion

membrane; Peripheral membrane protein. Endosome. Cytoplasmic vesicle,

autophagosome. Interaction with ATG14 promotes translocation to

autophagosomes. Expressed in dendrites and cell bodies of cerebellar Purkinje cells (By similarity). .; [Beclin-1-C 35 kDa]: Mitochondrion . Nucleus . Cytoplasm .;
