Background: The protein encoded by this gene is a deubiquitylase that binds ERCC1, the

> catalytic subunit of the XPF-ERCC1 DNA repair endonuclease. This endonuclease is a critical regulator of DNA repair processes, and the deubiquitylase activity of the encoded protein is important for maintaining the

DNA repair ability of XPF-ERCC1. [provided by RefSeq, Sep 2016],

Function: catalytic activity: Ubiquitin C-terminal thioester + H(2)O = ubiquitin + a

> thiol., similarity: Belongs to the peptidase C19 family., similarity: Contains 1 UBPtype zinc finger., tissue specificity: Broadly expressed, with highest levels in ovary,

skeletal muscle and spleen.,

Subcellular Location:

Photoreceptor inner segment . Cytoplasm . Nucleus .

Expression: Widely expressed. High expression is detected in the cerebellum. In the eye, it is

expressed at high levels in the optic nerve, sclera and retina, with relatively low levels in the choroid, lens and retinal pigment epithelium (PubMed:30573563).
