nuclear proteins that are responsible for the nucleosome nosomal fiber in eukaryotes. This structure consists of o of DNA wrapped around a nucleosome, an octamer each of the four core histones (H2A, H2B, H3, and H4). The ther compacted through the interaction of a linker histone, ween the nucleosomes to form higher order chromatin is intronless and encodes a replication-dependent histone he histone H3 family. Transcripts from this gene lack polyA ntain a palindromic termination element. This gene is found ene cluster on chromosome 6p22-p21.3. [provided by
