

## Cytokeratin 7 (ABT436) IHC kit

| Catalog No :             | IHCM6056  |
|--------------------------|---|
| Reactivity :             | Human;  |
| Applications :           | IHC   |
| Target :                 | Cytokeratin 7   |
| Gene Name :              | KRT7 SCL  |
| Protein Name :           | CK 7;CK-7;CK7;Cytokeratin<br>7;Cytokeratin-7;D15Wsu77e;K2C7;K2C7_HUMAN;K7;Keratin 7;Keratin 7, type<br>II;Keratin type II cytoskeletal 7;Keratin, 55K type II cytoskeletal;Keratin, simple<br>epithelial;Keratin,   |
| Human Swiss Prot<br>No : | P08729  |
| Mouse Swiss Prot         | Q9DCV7  |
| Rat Swiss Prot No :      | Q6IG12  |
| Immunogen :              | Synthesized peptide derived from human Cytokeratin 7 AA range: 350-469  |
| Specificity :            | The antibody can specifically recognize human CK7 protein, and shows no cross reaction with CK1, 4, 5, 6, 8, 10, 14, 17, 18, 19, 20.  |
| Source :                 | Mouse, Monoclonal/IgG1, kappa   |
| Purification :           | The antibody was affinity-purified from ascites by affinity-chromatography using specific immunogen.  |
| Storage Stability :      | 2°C to 8°C/1 year   |
| Background :             | keratin 7(KRT7) Homo sapiens The protein encoded by this gene is a member<br>of the keratin gene family. The type II cytokeratins consist of basic or neutral<br>proteins which are arranged in pairs of heterotypic keratin chains coexpressed<br>during differentiation of simple and stratified epithelial tissues. This type II<br>cytokeratin is specifically expressed in the simple epithelia lining the cavities of<br>the internal organs and in the gland ducts and blood vessels. The genes encoding |

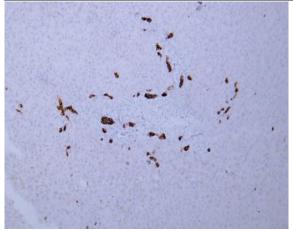

|                           | the type II cytokeratins are clustered in a region of chromosome 12q12-q13.<br>Alternative splicing may result in several transcript variants; however, not all<br>variants have been fully described. [provided by RefSeq, Jul 2008],  |
|---------------------------|---|
| Function :                | function:Blocks interferon-dependent interphase and stimulates DNA synthesis<br>in cells. Involved in the translational regulation of the human papillomavirus type<br>16 E7 mRNA (HPV16 E7).,induction:Up-regulated by retinoic acid.,mass<br>spectrometry: PubMed:11840567,miscellaneous:There are two types of<br>cytoskeletal and microfibrillar keratin: I (acidic; 40-55 kDa) and II (neutral to basic;<br>56-70 kDa).,PTM:Arg-20 is dimethylated, probably to asymmetric<br>dimethylarginine.,similarity:Belongs to the intermediate filament<br>family.,subunit:Heterotetramer of two type I and two type II keratins. Interacts with<br>eukaryotic translation initiator factor 3 (eIF3) subunit EIF3S10 and with HPV16<br>E7.,tissue specificity:Expressed in cultured epidermal, bronchial and mesothelial<br>cells but absent in colon, ectocervix and liver. Observed throughout the glandular<br>cells in the junction between stomach and esophagus bu |
| Subcellular<br>Location : | Cytoplasmic, Membranous   |
| Expression :              | Pancreas  |

## **Products Images**

Human kidney tissue was stained with Anti-Cytokeratin 7 (ABT436) Antibody

Human liver tissue was stained with Anti-Cytokeratin 7 (ABT436) Antibody
