

### Cytokeratin 4 (ABT061) Mouse mAb (Ready to Use)

Catalog No: YM6869R

**Reactivity:** Human

**Applications:** IHC

Target: Cytokeratin 4

Gene Name: KRT4 CYK4

Protein Name: Cytokeratin-4

**Human Swiss Prot** 

No:

Immunogen: Synthesized peptide derived from human CK4 AA range: 400-534

**Specificity:** The antibody can specifically recognize human CK4 protein, and shows no

cross reaction with CK5, 6, 7, 8, 14, 15, 17, 20.

**Formulation:** Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.

**Source:** Mouse, Monoclonal/IgG1, Kappa

P19013

**Dilution:** Ready to use for IHC

**Purification:** The antibody was affinity-purified from mouse ascites by affinity-

chromatography using specific immunogen.

Storage Stability: 2°C to 8°C/1 year

**Background :** keratin 4(KRT4) Homo sapiens The protein encoded by this gene is a member

of the keratin gene family. The type II cytokeratins consist of basic or neutral proteins which are arranged in pairs of heterotypic keratin chains coexpressed during differentiation of simple and stratified epithelial tissues. This type II cytokeratin is specifically expressed in differentiated layers of the mucosal and esophageal epithelia with family member KRT13. Mutations in these genes have been associated with White Sponge Nevus, characterized by oral, esophageal, and anal leukoplakia. The type II cytokeratins are clustered in a region of

chromosome 12g12-g13. [provided by RefSeg, Jul 2008],

1/3

#### **Function:**

disease:Defects in KRT4 are a cause of white sponge nevus of cannon (WSN) [MIM:193900]. WSN is a rare autosomal dominant disorder which predominantly affects non-cornified stratified squamous epithelia. Clinically, it is characterized by the presence of soft, white, and spongy plaques in the oral mucosa. The characteristic histopathologic features are epithelial thickening, parakeratosis, and vacuolization of the suprabasal layer of oral epithelial keratinocytes. Less frequently the mucous membranes of the nose, esophagus, genitalia and rectum are involved.,miscellaneous:There are two types of cytoskeletal and microfibrillar keratin: I (acidic; 40-55 kDa) and II (neutral to basic; 56-70 kDa).,polymorphism:Three alleles of K4 are known: K4A2 (shown here), K4A1 and K4B.,similarity:Belongs to the intermediate filament family.,subunit:Heterotetramer of two type I and two type II keratins. Ke

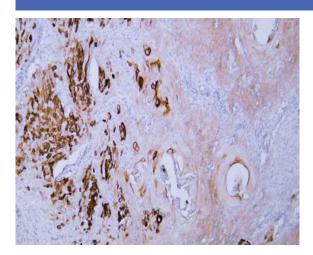

# Subcellular Location :

## **Expression:**

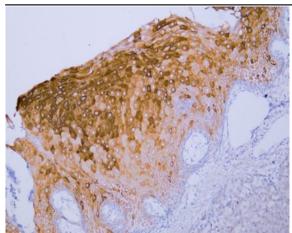

#### Cytoplasmic, Membranous

Detected in the suprabasal layer of the stratified epithelium of the esophagus, exocervix, vagina, mouth and lingual mucosa, and in cells and cell clusters in the mucosa and serous gland ducts of the esophageal submucosa (at protein level). Expressed widely in the exocervix and esophageal epithelium, with lowest levels detected in the basal cell layer.

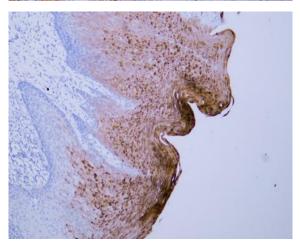

## **Products Images**

Human cervical squamous cell carcinoma tissue was stained with Anti-Cytokeratin 4 (ABT061) Antibody

Human esophageal squamous cell carcinoma tissue was stained with Anti-Cytokeratin 4 (ABT061) Antibody

Human oral squamous cell carcinoma tissue was stained with Anti-Cytokeratin 4 (ABT061) Antibody
