Cellular Nucleus. Nucleus, PML body.

Tissue specificity Broadly expressed.

Function Function:Ubiguitin-like protein which can be covalently attached to target lysines either as a monomer or as a lysine-linked polymer. Does not seem to be involved in protein degradation and may function as an antagonist of ubiguitin in the degradation process. Plays a role in a number of cellular processes such as nuclear transport, DNA replication and repair, mitosis and signal transduction. Covalent attachment to its substrates requires prior activation by the E1 complex SAE1-SAE2 and linkage to the E2 enzyme UBE2I, and can be promoted by an E3 ligase such as PIAS1-4, RANBP2 or CBX4., online information; SUMO protein entry, PTM: Cleavage of precursor form by SENP1 or SENP2 is necessary for function.,PTM:Cleavage of precursor form by SENP1, SENP2 or SENP5 is necessary for function., PTM: Polymeric chains can be formed through Lys-11 crosslinking., similarity: Belongs to the ubiguitin family. SUMO subfamily., similarity: Contains 1 ubiquitin-like domain., subcellular location: Nuclear bodies., subunit: Homotrimer (Potential). Crystal packing analysis suggests a possible trimeric assembly, of which the biological significance remains to be determined. Interacts with SAE2 and UBE2I. Covalently attached to a number of proteins. Interacts with PELP1., subunit: Interacts with SAE2 and UBE21. Covalently attached to a number of proteins.,tissue specificity:Broadly expressed.,tissue specificity: Expressed predominantly in liver.,
