### Immunogen Information

**Immunogen** The antiserum was produced against synthesized peptide derived from human CSFR around the phosphorylation site of Tyr561. AA range: 531-580**Specificity** Phospho-c-Fms (Y561) Polyclonal Antibody detects endogenous levels of c-Fms protein only when phosphorylated at Y561. The name of modified sites may be influenced by many factors, such as species (the modified site was not originally found in human samples) and the change of protein sequence (the previous protein sequence is incomplete, and the protein sequence may be prolonged with the development of protein sequencing technology). When naming, we will use the "numbers" in historical reference to keep the sites consistent with the reports. The antibody binds to the following modification sequence (lowercase letters are modification sites): NSyTF
